

Notice

This document was prepared by the United States Environmental Protection Agency with support provided by Environmental Management Support, Inc., under Contracts No. 68-W6-0014 and 68-W-00-084. Contractor support for the production of this document was managed by John Quander of EPA's Technology Innovation Office. Any questions regarding this document should be directed to Mr. Quander at 703-603-7198. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise does not constitute or imply endorsement, recommendation, or favoring by EPA or other agencies participating in the production of this document.

EXECUTIVE SUMMARY

The development of new and innovative technologies for treating hazardous environmental contaminants is a critical step in the effort to cleanup the nation's hazardous waste sites. Field demonstration of these technologies is, in turn, a key step in their development.

The U.S. government, several state governments, and the government of Canada encourage the development of innovative technologies for treating hazardous substances through a number of programs and partnerships with technology developers and vendors. Several of these programs facilitate field demonstration of these technologies, including sponsoring demonstrations, providing sites for demonstrations, and brokering demonstration agreements between site owners and technology developers.

This document gathers information on completed and on-going field-scale demonstrations of new and innovative remediation technologies to provide both a snapshot of the current state of remediation technology development and a resource for those interested in finding out more about technology demonstration projects and subject areas.

The matrix in this document provides information on nearly 600 projects, including data on media and contaminants treated, dates of demonstration projects, and report reference and contact information. An online, searchable database of the information in this document also is available at clu-in.org/products/nairt. Updated information on the projects future projects will be available in the online database, which will take the place of this document.

INTRODUCTION

The development of new and innovative technologies and methods for treating environmental contaminants is a critical step in the effort to cleanup the nation's hazardous waste sites. Field demonstration of these technologies is, in turn, a key step in their development. The continuing investment of public and private resources in demonstration projects represents a major commitment to promoting the technical and cost advantages offered by these technologies to the engineering and regulatory sectors. Since the mid-1980's, the number of government-sponsored or supported field demonstrations of new waste cleanup technologies has grown to over six hundred.

The 599 projects summarized in this document are both ongoing and completed field demonstrations of technologies for treating environmental contaminants. All projects are sponsored by government agencies, usually working in partnership with private technology developers to bring new technologies into the marketplace. Given the wide number of government sponsors and other partners that support these demonstrations, records and data are unfortunately spread over a large number of technical reports and other sources, making it difficult for environmental cleanup project managers and other professionals to locate this information. This report consolidates key reference information in a matrix that allows project managers to quickly identify new technologies that may answer their cleanup needs and provides contacts for obtaining technology demonstration results and other information.

Since the publication of the first edition of this report in 1996 (*Completed North American Innovative Remediation Technology Demonstration Projects* EPA 542-B-96-002), information on 340 projects have been added to the reference matrix that forms the core of this document, bringing the total number reported to 599 projects. The scope of reporting for this edition has been expanded to include information from ongoing field demonstrations that are able to provide at least partial results. The overall scope remains restricted to field-scale projects. Emerging technology research and laboratory-scale demonstration projects are not included. The intention is to provide information on technologies that are approaching commercial viability and may help remedial and corrective action project managers in dealing with near-term cleanup issues and decisions.

The increase in the number of demonstrations in this edition reflects developments in new technology areas such as phytoremediation, permeable reactive barriers, and enhanced bioremediation. The evolution of new and innovative technologies also is reflected in the drop-off over time in the number of projects addressing more established technologies that were once considered innovative, such as soil vapor extraction, and others. For example, the first edition did not report any field demonstrations for several new technology areas listed above. This edition includes information on phytoremediation and permeable reactive barrier projects that were not included in the first edition. By contrast, only six demonstrations of soil vapor extraction techniques were identified since the first edition.

An online, searchable database of the information in this document also is available at:

<clu-in.org/products/nairt>

The online version allows users to create custom searches of project data by contaminant type, media, and technology type. Updates of project information and data on future projects will be available in the online database, which will take the place of this document. The information in the online version will be updated quarterly to ensure that new projects are reported.

The matrices of field demonstration projects in this report cover two media: soil, sludge, and sediment projects in the first matrix; groundwater projects in the second. Individual projects in each matrix are grouped into technology types (ex situ biological, in situ biological, ex situ physical/chemical, and in situ physical/chemical). The first matrix also breaks out ex situ and in situ thermal and off-gas treatment projects in the soil, sludge, and sediment group. The matrix includes the following information for each project (as available):

Name of the technology or process	Project report title and reference information
Type(s) of contaminant(s) treated	Developer/vendor contact information
Technical comments	Government agency sponsor key
Description of the site or waste source	Inclusion in EPA REACH IT (yes/no)
Demonstration date (year)	

An appendix to this edition provides further information on the major state and federal technology demonstration programs that sponsor the demonstrations listed in the matrix.

Overview of Demonstration Projects

MATRIX OF FIELD-SCALE INNOVATIVE REMEDIATION TECHNOLOGY DEMONSTRATION PROJECTS

Using the Matrix

The following matrix summarizes information for 601 completed and on-going field-scale demonstration projects. The data in the matrix represents the information reported for the project. The projects in the matrix are organized as follows:

- a) Projects are separated according to media: Soil, Sludge, and Sediment Projects; and Groundwater Projects
- b) Within the media categories, projects are separated by technology type: Ex-Situ Biological; In-Situ Biological; Ex-Situ Physical or Chemical; In-Situ Physical or Chemical; Ex-Situ Thermal; In-Situ Thermal; Off-Gas Treatment (soil only)
- c) Within the categories listed above, projects are listed alphabetically by technology

To avoid double-counting, cross-media and cross-technology projects are included in their principal categories. For example, technologies that address dense non-aqueous phase liquid (DNAPL) sources (such as dynamic underground stripping) may be applicable to both soil and groundwater and have thermal and physical/chemical technology components. Placement in the matrix in such a case depends on the intended application of the technology and the principal media of concern.

The matrix presents the following information for each project:

Column	Column Name and Definition
1	Technology: Name of Technology
2-7	Contaminant(s): An "X" indicates the type(s) of contaminant(s) treated <ul style="list-style-type: none"> - halogenated volatile organic compounds (VOCs) - nonhalogenated VOCs - halogenated semivolatile organic compounds (SVOCs) - nonhalogenated SVOCs - Inorganic compounds - Explosives or propellants
8	Technical Comment Field: Specific contaminant(s) treated
9	Site or Waste Source Type: Background information on the industrial use of the demonstration site or the type of contamination source
10	Demonstration Date: Date (year) of the project. Usually the year listed is the start date for the demonstration project; however, in some cases the date reflects the year a report was issued. "Open" means the project is on-going

- 11 *Project Report Title* Reference Number (Page Number): Citations for published reports and other information for the project: titles are in italics; references numbers for identifying documents are in typeface; page numbers for finding information within documents are in parentheses
- 12 Contact: Contact information for the developer, vendor, or other information source for the project
- 13 Sponsor: Name of the government agency sponsor of the project
- 14 EPA REACHIT: An “X” indicates that information for the project can be found in the EPA REACHIT system

EPA’s Remediation and Characterization Innovative Technologies (EPA REACH IT) system consolidates electronic data for site characterization and remediation technologies into an online searchable database. EPA REACH IT combines information from three established EPA databases, the Vendor Information System for Innovative Treatment Technologies (VISITT), the Vendor Field Analytical and Characterization Technologies System (Vendor FACTS), and the Innovative Treatment Technologies (ITT), to give users access to comprehensive information about treatment and characterization technologies and their applications. It combines information submitted by technology service providers about remediation and characterization technologies with information from EPA, the U.S. Department of Defense (DoD), the U.S. Department of Energy (DOE), and state project managers about sites at which innovative technologies are being deployed.

INNOVATIVE REMEDIATION TECHNOLOGY DEMONSTRATION PROGRAMS

The following federal and state government organizations have sponsored or conducted innovative technology demonstration projects.

Environment Canada

Environment Canada supports innovative remediation technology demonstration and development through the following programs:

Environmental Technology Verification

Environment Canada's Environmental Technology Verification (ETV) Program is designed to foster the growth and marketability of Canada's environment industry, by providing validation and independent verification of performance claims. A key component of the Program is that it will give companies a Government of Canada "Certificate of Authenticity" enabling innovative environmental technologies to access markets more effectively.

Environment Canada and California EPA have signed an agreement to facilitate the exchange of information and reciprocity on their respective verification programs. As well, Canada and the U.S. EPA have a Cooperative Agreement in place to examine the harmonization of verification initiatives.

Environment Canada and Industry Canada have awarded a contract to ETV Canada Inc., a private sector company, to deliver the ETV Program. The company is owned by TerraChoice Environmental Services Inc. (which delivers the Environmental Choice Program) and the Ontario Centre for Environmental Technology Advancement (OCETA), which also represents Enviro-Accès and CETAC-West (see below). An extensive cross-Canada network of environmental organizations, qualified to serve as Verification Entities, will be subcontracted to provide verification services.

For More Information

ETV Canada Inc.

300-2197 Riverside Drive

Ottawa, ON K1H 7X3 Canada

Telephone: 613-247-1900

Fax: 613-247-2228

Canadian Environmental Technology Advancement Centres

Environment Canada sponsors three Canadian Environmental Technology Advancement Centres (CETACs), in partnership with provincial governments, environmental industry associations, and the private sector. The CETACs are private sector, not-for-profit corporations, operating at arm's length from government. Each Centre's goal is to help small and medium sized enterprises (SMEs) commercialize environmental technologies by providing comprehensive technical services, access to investment capital, business counseling, and regulatory and market analysis.

The three CETACs are:

Enviro-Access Inc.
855, rue Pepin, Office 310
Sherbrooke, Quebec J1L 2P8

California Environmental Protection Agency

California Environmental Technology Certification Program

The California Environmental Technology Certification Program is a voluntary program that provides participating technology developers, manufacturers, and vendors an independent, recognized third-party evaluation of the performance of new and mature environmental technologies. Developers and manufacturers define quantitative performance claims for their technologies and provide supporting documentation; Cal/EPA reviews that information and, where necessary, conducts additional testing to verify the claims. The technologies, equipment, and products that are proven to work as claimed receive official state certification. The certification program is voluntary and self-supporting. Companies participating in the program pay the costs of evaluating and certifying their technologies. For more information, please contact Tam Doduc (phone: 916-327-5789; email: tdoduc@arb.ca.gov).

U.S. Department of Defense

Air Force Center for Environmental Excellence

The Air Force Center for Environmental Excellence (AFCEE) has an Innovative Technology Program that identifies and field tests innovative site characterization, remediation, and pollution prevention technologies, with an emphasis on technologies that save time and money and facilitate compliance with air, soil, and water regulations.

Special areas of interest within the Innovative Technology Program include:

- C remediation technologies that treat fuels, chlorinated solvents, pesticides, PCBs, and heavy metals;
- C vapor phase capture and treatment;
- C cost effective site characterization;
- C stripping and removal of protective coatings;
- C parts cleaning and degreasing; and
- C industrial process sludge treatment.

Successful projects have been based on sound scientific principles and offer widespread applicability to Air Force sites and significant cost savings.

Environmental Security Technology Certification Program

ESTCP's goal is to demonstrate and validate promising, innovative technologies that target the Department of Defense's (DoD's) most urgent environmental needs. These technologies provide a return on investment through cost savings and improved efficiency. ESTCP's strategy is to select lab-proven technologies with broad DoD and market application. These projects are aggressively moved to the field for rigorous trials that document their cost, performance, and market potential. To ensure that the demonstrated technologies have a real impact, ESTCP incorporates these players in the development and execution of each technology. ESTCP demonstrations—

- C Address real DoD environmental needs.
- C Significantly reduce costs and risks and expedite implementation.
- C Document and validate the cost and performance of new technologies for DoD end-users and the regulatory community.

The ESTCP Process (below) ensures approved technologies meet DoD environmental challenges:

- DoD environmental requirements are specified.
- ESTCP requests proposals.
- Rigorous and expert scientific reviews are made.
- ESTCP projects are selected in cleanup, compliance, and pollution prevention.
- Technologies are demonstrated and evaluated at DoD sites.
- Cost and performance data are validated.
- Effective and affordable technologies are transferred across DoD.

National Environmental Technology Test Sites (NETTS) Program

The National Environmental Technology Test Sites (NETTS) Program, sponsored by SERDP, is an environmental technology testing and evaluation program that provides locations, facilities, and support for applied research demonstration, and evaluation of innovative cleanup and characterization technologies that are candidates for Installation Restoration efforts at DoD facilities. NETTS promotes technology transfer from research to proof-of principle demonstration and facilitates expeditious transfer of technologies between government agencies and the private sector.

There are currently four DoD SERDP NETTS Test Sites and one NETTS technology support center which focus on the proof-of-principle demonstrations of cleanup technologies. They consist of:

Dover NETTS Test Site: The Dover National Test Site (DNTS) at Dover AFB provides sites where research can be conducted on the transport, detection, monitoring, and cleanup of solvent and fuel contaminants in the subsurface. DNTS provides a unique opportunity for conducting experimental, contained releases of dense nonaqueous phase liquids (DNAPLs). DNTS also provides other well-characterized contaminated plume sites and support services.

McClellan NETTS Test Site: The Air Force also manages a Chlorinated Hydrocarbon Remedial Demonstration Site at McClellan AFB, which provides areas to evaluate investigative technologies and remediation technologies for chlorinated hydrocarbons contamination in soil and groundwater.

Naval Facilities Engineering Service Center NETTS Test Site: The Environmental Technology Demonstration Site at Port Hueneme, California, provides *in situ* and *ex situ* locations to demonstrate advanced fuel hydrocarbon remediation technologies for treatment of fuels contamination in soil and groundwater. Areas include a soil stockpile facility contaminated with fuels; an 11-acre gasoline station plume; and underground storage tank and spill areas.

Former Wurtsmith AFB NETTS Test Site: The National Center for Integrated Bioremediation Research and Development at Wurtsmith AFB, Michigan, co-sponsored by EPA and the university of Michigan, operates a controlled field test-bed facility for investigations to support the design and engineering of integrated bioremediation systems. This project focuses on *in situ* bioremediation of soils, surface water, and groundwater contaminated by fuels, solvents and other organic substances.

EPA NETTS Technical Support Center: EPA also co-sponsors the Environmental Technology Verification program's Site Characterization and Monitoring Technology pilot, established by the National Exposure Research Laboratory/Characterization Research Division, Las Vegas, Nevada, which identifies, demonstrates, evaluates, verifies, and transfers data about innovative monitoring, measurement, and site characterization technologies. Planning assistance is offered to developers to ensure verified data collection and to extend the application of new technologies to other sites.

Naval Environmental Leadership Program

The Naval Environmental Leadership Program (NELP) seeks to expedite cleanup and compliance at two Naval installations (Naval Air Station North Island, San Diego, California, and Naval Station Mayport, Jacksonville, Florida) using innovative technologies and focused management. The two NELP bases serve as prototypes for identification, development, testing, implementation, evaluation, and refinement of new initiatives and export of successful applications for implementation as part of the Navy's Environmental Management Program.

Interested public or private sector parties in possession of innovative technologies that may be implemented at full-scale to address environmental problems at the two NELP bases and that address problems of concern in the Navy-wide environmental management program may be eligible to participate in NELP. Innovative technologies are selected and included in the Program through a variety of mechanisms. The NELP Initiative solicits proposals for innovative technologies via the *Commerce Business Daily*.

NELP emphasizes full-scale technology implementation to solve an environmental problem at one of the NELP bases. It is not an R&D program; however, the NELP Initiative may serve as a host for technology demonstrations if the developer requires a demonstration site, once the NELP bases meets the requirements for a successful demonstration, and funding is provided by the developer or other source. Successful demonstrations will lead to full-scale implementation at the NELP base and within the execution of the Navy's Installation Restoration Program.

Strategic Environmental Research and Development Program

The Strategic Environmental Research and Development Program (SERDP) is a multiagency program funded through the Department of Defense. SERDP responds to environmental needs of DoD, along with those it shares with the Department of Energy, the Environmental Protection Agency, and other federal government agencies.

SERDP seeks to identify, develop, demonstrate, and transition technology for four thrust areas. The four thrust areas correspond to the four pillars of DoD's Environmental Quality Program: environmental cleanup technology is one of the thrust areas. Specific objectives of the cleanup technology thrust area focus on conducting research and development to achieve more effective and efficient environmental characterization, assessment, monitoring, and cleanup of soil, sediment, groundwater, surface water, and structures contaminated by past defense practices with hazardous materials (including unexploded ordnance), and toxic substances. The cleanup technology area also seeks to:

- C develop cost-effective methods to determine fate, transport, and effects of contaminants related to defense activities;
- C develop risk-based modeling methods for establishing cleanup priorities; and
- C facilitate transfer of technology to field use by means of the proof-of-principle demonstration of R&D projects, particularly, at the SERDP National Environmental Technology Test Sites.

On an annual basis, SERDP solicits proposals from the federal and private sector in the areas of site characterization, monitoring, remediation, and risk assessment. Each year specific statements of needs are issued. For current topics of interest and information on how to become involved, please see the SERDP web site.

Unexploded Ordnance Technology Demonstration Program

JPG Phases I, II, III and Live Site Projects

The Congressionally funded Unexploded Ordnance (UXO) Technology Demonstration Program has established technology performance baselines by demonstrating and highlighting the strengths and capabilities of numerous UXO technologies. The U.S. Army Environmental Center (USAEC), in partnership with the Naval Explosive Ordnance Disposal Technology Division, has conducted over 60 demonstrations of UXO characterization and remediation technology. Phase I, Phase II and Phase III were conducted in 1994, 1995 and 1996 at the U.S. Army Jefferson Proving Ground in Madison, IN. These demonstrations were performed on a controlled test site containing a known baseline.

The UXO Technology Demonstration Program has highlighted the capabilities and limitations of UXO technologies. Demonstrators show continued improvement in detection performance. But because there has been no substantial improvement in the ability to discriminate UXO from the clutter, focused efforts are needed. The Phase IV effort, currently underway, will capitalize upon the previous UXO technological investments by focusing on target discrimination and reduction of false alarms rates. This will provide the government with economical and effective technology that will significantly reduce the overall cost of UXO clearance, by reducing the number of anomalies which must be found.

U.S. Army Environmental Center

The Environmental Technology Transfer and Technology Demonstration Branches within the Pollution Prevention and Environmental Technology Division (P2&ETD) develop, demonstrate, and deliver tools to help the Army sustain readiness, protect resources, and improve soldiers' quality of life. These programs enable the Army to test and implement cost-effective technologies in pollution prevention, conservation, compliance, and restoration. From cleanup devices to better ways of doing business, these innovations protect the environment while supporting military operations, installation management, and material development.

P2&ETD assesses Army environmental needs and works with researchers and future users to adapt ideas. P2&ETD searches government labs or finds "off the shelf" commercial tools with potential military application. P2&ETD produces "real world" cost and performance data by testing lab-proven technologies in field demonstrations. P2&ETD helps transfer successful products to the Army community, tracking technology performance and user needs even after the demonstration.

P2&ETD's guidance and technical support programs address the main elements of the Army's environmental program, meeting specific user needs on pollution prevention, conservation, compliance, and restoration, as well as specialized programs in SCAPS, UXO, and Range XXI.

U.S. Department of Energy

Industry and University Programs Area

The mission of the Industry and University Programs Area is to identify and provide development support for technologies that show promise in addressing DOE's Environmental Management needs, but require proof-of-principle experimentation and already proven technologies in other fields that require critical path experimentation to demonstrate feasibility for adaptation to specific EM needs.

Program Research & Development Announcements/Research Opportunity Announcements

Program R&D Announcements (PRDAs) and Research Opportunity Announcements (ROAs) are DOE's major assistance vehicles for developing technologies. PRDAs solicit a broad mix of proposals where R&D, including demonstration, testing, and evaluation, is required within broadly defined areas of interest. DOE may issue a PRDA in response to an individual program need such as the cleanup of a particular contaminant at a specific site. Multiple awards for proposals, which may have varied approaches or concepts, are generally made. Numerous PRDAs may be issued each year.

ROAs solicit industry and academic proposals throughout the year ("rolling admissions") for potential contracts in applied research. ROAs support research efforts for the development of technologies with potential application in the EM program. A proposed technology should improve DOE's capabilities in areas such as *in situ* remediation; detection, characterization, and monitoring; efficient separations technology for radioactive waste; and robotics. ROAs are published in the *Commerce Business Daily*. The program includes some set-asides for small businesses. DOE anticipates making 25-30 awards through an active ROA at its Morgantown facility.

For information on the full range of DOE/EM assistance programs, contact the EM Central Point of Contact (CPOC). The CPOC is a referral service that expedites and monitors private sector interaction with EM. The CPOC can identify links between technologies and program needs and connect potential partners with an extensive network of Headquarters and field program contacts.

TechCon

TechCon is a DOE program developed to increase the use of commercially available technologies at DOE cleanup sites with an emphasis on technologies that have shown superior performance characteristics. TechCon's mission is to identify, screen, and support the implementation of available environmental technologies from both the private and public sector in the U.S. as well as from international sources.

The TechCon Program works with sites to identify clean-up needs, finds commercially available technologies and services that have proven performance capabilities, matches technologies to needs at

DOE sites, and delivers information on these technologies to site personnel. By connecting representatives of technology companies with those at remediation sites, TechCon promotes the use of available technologies and resolves barriers to their field application. A key to TechCon's success is improving communication among companies, site representatives, and regulators. To that end, TechCon has instituted an electronic mail discussion list that is hosted at ANL. With over 60 members, including DOE, EPA, site contractor, and technology company personnel, this e-mail list facilitates dissemination of information and can expedite the matching of technology needs with commercially available technologies.

Technology Development Initiative

DOE's Technology Deployment Initiative (TDI) seeks to:

- C achieve multiple deployments of cleanup technologies and processes that expedite DOE's environmental management effort,
- C obtain third party validation of cost savings,
- C facilitate the reinvestment of cost savings to increase participation in the program, and
- C break down barriers to the implementation of new technologies.

Under TDI, technologies selected for participation and deployment support DOE's environmental management mission and provide for multiple applications. Applications include a Pricing Proposal that compares an estimated cost with that of a baseline technology; the technology should accelerate or reduce the cost of that referenced baseline, or both. Applications must also include a commitment from the proposing DOE site manager. TDI funding is for deployment of commercial-ready technologies, rather than demonstrations.

Ranking criteria for applicants are divided into four areas: impact/technical approach; business management approach; stakeholder/regulatory management approach; and cost. Incentives for developers to participate in TDI include the availability of funds to accelerate deployment and cleanup, increased visibility for the technologies through deployment and the generation of validated cost savings, multiple state acceptance of the technology, and the opportunity for reinvestment of cost savings.

U.S. Environmental Protection Agency

Environmental Technology Verification Program

Over the years, EPA has evaluated technologies to determine their effectiveness in preventing, controlling, and cleaning up pollution. EPA has expanded these efforts by instituting the Environmental Technology Verification (ETV) Program to verify the performance of a larger universe of innovative technical solutions to problems that threaten human health or the environment. ETV accelerates the entrance of new environmental technologies into the marketplace by supplying technology buyers and developers, consulting engineers, States, and EPA Regions with high quality data on the performance of new technologies.

EPA utilizes the expertise of partner “verification organizations” to design efficient processes for conducting performance tests of innovative technologies. EPA selects its partners from both the public and private sectors including Federal laboratories, States, universities, and private sector facilities. Verification organizations will oversee and report verification activities based on testing and quality assurance protocols developed with input from major stakeholders/customer groups associated with the technology area.

Verification under ETV means confirmation of the performance characteristics of a commercial-ready environmental technologies through the evaluation of objective and quality assured data. ETV’s targeted customers are:

- Technology users and purchasers
- Technology enablers
 - permitters, regulators
 - consulting engineers
- Technology developers and vendors

Each pilot will announce its intention to begin accepting technologies for verification in the *Commerce Business Daily* and in the trade press.

Remediation Technologies Development Forum

The Remediation Technologies Development Forum (RTDF) was established in 1992 by EPA to identify ways of working together with industry to solve complex hazardous waste remediation problems. The RTDF

is open to all interested parties and has grown to a consortium of partners from private industry, government agencies, and academia who share the common goal of developing more effective, less costly hazardous waste characterization and treatment technologies. RTDF partnerships undertake research, development, demonstration, testing, and evaluation efforts to achieve common cleanup goals.

The RTDF advances the development of cost-effective technologies for the remediation of hazardous wastes, and works to achieve these goals by:

- C identifying priority remediation technology development needs;
- C establishing and overseeing action teams to plan and implement collaborative research projects to address these needs; and
- C addressing scientific, institutional, and regulatory barriers to innovative treatment technologies.

RTDF members establish self-managed action teams that bring members together to work on their highest priority problems. These teams define technology research needs, develop and implement research project plans, and produce and disseminate scientifically credible results to facilitate broad acceptance of the technology.

EPA facilitates the operation of the Action Teams and the RTDF Steering Committee, and contributes its research efforts to the jointly-led projects. EPA provides funding for RTDF research activities and Action Team meetings. Other federal agencies, industry, and academic participants also provide funding, laboratory, and field support for Action Team projects. Participants in each Action Team provide funding and/or in-kind support for the Team's research efforts.

Superfund Innovative Technology Evaluation Program

The U.S. Environmental Protection Agency's (EPA) Superfund Innovative Technology Evaluation (SITE) Program was established by EPA's Office of Solid Waste and Emergency Response and the Office of Research and Development (ORD) in response to the 1986 Superfund Amendments and Reauthorization Act, which recognized a need for an "Alternative or Innovative Treatment Technology Research and Demonstration Program." The SITE Program is administered by ORD National Risk Management Research Laboratory in the Land Remediation and Pollution Control Division (LRPCD), headquartered in Cincinnati, Ohio. The SITE Demonstration Program encourages the development and implementation of (1) innovative treatment technologies for hazardous waste site remediation and (2) monitoring and measurement.

In the SITE Demonstration Program, the technology is field-tested on hazardous waste materials. Engineering and cost data are gathered on the innovative technology so that potential users can assess the technology's applicability to a particular site. Data collected during the field demonstration are used to assess the performance of the technology, the potential need for pre- and post-processing of the waste, applicable types of wastes and waste matrices, potential operating problems, and approximate capital and operating costs.

At the conclusion of a SITE demonstration, EPA prepares an Innovative Technology Evaluation Report, Technology Capsule, and Demonstration Bulletin. These reports evaluate all available information on the technology and analyze its overall applicability to other site characteristics, waste types, and waste matrices. Testing procedures, performance and cost data, and quality assurance and quality standards are also presented.
